IKI-Gov Assess

Gate the AI use case before it ships, and keep the proof that you did.

presidio-hardened-ikigov-assess · v0.29 · MIT licence · pip install presidio-hardened-ikigov-assess

THE PROBLEM

Governance that lives in a policy fails its first audit.

A policy describes a process. An auditor asks for a decision. The policy answers none of these four questions; a gate record answers all of them.

Which use case?

`--use-case`

Which gate?

`--gate G0…G5`

On what evidence?

`--evidence`

Signed by whom?

`--issuer`

THE MODEL

One lifecycle, six gates.

Every AI system passes the same seven phases. A gate sits at each transition, and it opens only when the items behind it are in place.

Lifecycle and gates of the IKI-Gov reference model.

- **G0** Context → Concept
- **G1** Concept → Development
- **G2** Development → Release
- **G3** Release → Operation
- **G4** Operation → Adaptation
- **G5** Adaptation → Decommissioning

HOW IT SCORES

Twenty-five answers. Six scores. Six decisions.

Affirm an item, skip it, or leave it open. The tool scores six dimensions of maturity and decides each gate: OPEN, PARTIAL or BLOCKED.

25

checklist items

`S, D, T, O, I · five each`

→

6

maturity dimensions

`M1–M6, each 0–100 %`

→

6

quality gates

`G0–G5, one status each`

RISK CLASSES

Risk decides what a skip costs.

Low risk

A skipped item is forgiven. The gate stays open.

OPEN

Medium risk

A skipped item is tolerated until someone affirms it.

PARTIAL

High risk

A skipped item is not permitted. It blocks the gate.

BLOCKED

--strict applies the high-risk rule at any risk class. An item left unanswered blocks its gates at every class.

CI/CD

A gate your pipeline can enforce.

```
$ iga gate --gate G2 --risk-class high \
    --affirm S1,S2,D1,D2,D3,D4,D5,T1,T2,T3 \
    --assert-gate G2
$ echo $?
0
```

A build that ships a blocked model fails the way a build with a failing test fails.

Exit	Gate status
0	OPEN, build passes
2	PARTIAL
3	BLOCKED
1	invalid input

EVIDENCE

Evidence counts. Assertions do not.

Under --require-evidence an item counts only when a signed evidence reference verifies against your trust store. A bare tick is recorded as asserted and scores nothing. A wrong key never verifies.

`asserted (not counted)` **`evidence-verified`** Ed25519 or HMAC, with key rotation

GATE CERTIFICATES

The certificate is the proof.

A gate certificate carries the answers, the evidence and the decision rule. Anyone recomputes the verdict locally: no database, no engine, no call home.

Each failure has a named reason, from bad-signature to expired. Expiry is the only revocation, by design.

cert.json · gate-certificate@1

use_case	credit-scoring
gate	G2
risk_class	high
decision	OPEN
affirmation_set	S1 … T3
predicate	ids, risk, hash
issuer	presidio-assessor
not_after	2027-01-18
signature	ed25519

REGULATION

One assessment, three regulatory views.

ISO/IEC 42001

Clauses 4 to 10 and Annex A.

`covered · partial · gap`

EU AI Act

Articles 9 to 18 and 72, for high-risk systems.

`OPEN · PARTIAL · BLOCKED`

NIST AI RMF

Govern, map, measure and manage.

`iga framework-gap`

Each framework ships as a versioned content pack. A new regulation is data; the engine stays as it is.

WORKSHOP MODE

Run the workshop offline. Leave a signed record.

An air-gapped laptop and a projector, under two minutes per use case. The customer signs the leave-behind with their own key; PRESIDIO countersigns as assessor.

1 Run
Project each use case and write its leave-behind.

2 Sign
The customer signs with a key made on their own hardware.

3 Attest
PRESIDIO countersigns. Either side can verify later.

SECURITY

Built like the controls it audits.

Local by default

Assessments live in a SQLite file only your account can read.

Fail-closed

A missing signature, an unknown signer or a tampered file verifies nothing.

Open

MIT licence, published on PyPI, OpenSSF Best Practices badge and Scorecard.

Agent-ready

An MCP server lets an AI agent check a gate before it acts.

THE BOOK

Grounded in the book.

The 25 items come from the book's framework chapter, and a test pins the tool to the book's worked example.

Like the book, the tool orients a team; it gives no legal advice.

PRESIDIO

GET STARTED

Assess your first use case today.

```
$ pip install presidio-hardened-ikigov-assess
$ iga assess --interactive --use-case my-first-model
```
